## Introduction

Numeracy, which encompasses all of the mathematical knowledge and skills an individual needs in order to function in society, is a goal that all students should achieve, no matter what path they may choose to follow in school. It can be attained through effective, controlled use of all the mathematical concepts set forth in the Québec Education Program.

This document is complementary to the mathematics program. It provides additional information on the knowledge and skills students must acquire throughout elementary school with respect to arithmetic, geometry, measurement, statistics and probability. Each of these branches is dealt with in a separate section that covers, for every year of elementary school, the knowledge to be acquired as well as the actions to be performed in order for students to fully assimilate the concepts presented. Each section consists of an introduction, which provides an overview of the progression of learning, and content tables, which illustrate the mathematical symbols and vocabulary to be introduced as students progress in their learning. This document should therefore help teachers with their lesson planning.

Because mathematics is a science that involves abstract concepts and language, students develop their mathematical thinking gradually through personal experience and exchanges with peers. Their learning is based on situations that are often drawn from everyday life. Thus, by participating in learning activities that encourage them to reflect, manipulate, explore, construct, simulate, discuss, structure and practise, students assimilate concepts, processes and strategies.<sup>1</sup> These activities allow students to use objects, manipulatives, references and various tools and instruments. They also enable students to rely on their intuition, sense of observation, manual skills and ability to express themselves, reflect and analyze—actions that are essential to the development of competencies. By making connections, visualizing mathematical objects in different ways and organizing them in their minds, students gradually develop their understanding of abstract mathematical concepts.

In this way, students build a set of tools that will allow them to communicate appropriately using mathematical language, reason effectively by making connections between mathematical concepts and processes, and solve situational problems. By using mathematical concepts and various strategies, students can make informed decisions in all areas of life. Combined with learning activities, the situations experienced by students promote the development of mathematical skills and attitudes that allow them to mobilize, consolidate and broaden their mathematical knowledge.

---

1. [Examples of strategies](#) are provided in the appendix.

# Mathematics

## Arithmetic

The concepts and processes to be acquired and mastered in arithmetic constitute the building blocks of mathematics, since they are applied in all other branches of this subject.

The learning content in arithmetic is divided into three sections: understanding and writing numbers, meaning of operations involving numbers, and operations involving numbers.

- Understanding and writing numbers
- Meaning of operations involving numbers
- Operations involving numbers

# Mathematics

## Arithmetic

The concepts and processes to be acquired and mastered in arithmetic constitute the building blocks of mathematics, since they are applied in all other branches of this subject.

### Understanding and writing numbers

Number sense is a concept that is developed in early childhood and is refined as students progress through school. In elementary school, it is developed first by looking at natural numbers and then enriched by studying rational numbers.<sup>1</sup>

At the outset, counting rhymes, counting, constructions, representations, ordering and establishing relationships among numbers are essential in order for students to understand number systems. Using appropriate manipulatives, students first learn about counting groups (grouping) and gradually replace this concept with place value. However, care must be taken not to progress too quickly from one concept to another, as this could affect the way students understand operations or learn new numbers.

It is in elementary school that students acquire the basic tools for understanding and using fractions. Students must first understand concepts (meaning) before they can understand calculation processes (operations). This can be achieved by allowing students to systematically use concrete materials and pictorial representations when dealing with situations involving fractions.

The table below presents the learning content associated with understanding and writing numbers. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

Understanding and writing numbers						
→	Student constructs knowledge with teacher guidance.					
	Elementary					
★	Cycle One		Cycle Two		Cycle Three	
	1	2	3	4	5	6
■	Student reinvests knowledge.					
A. Natural numbers less than . . .						
1. Counts or recites counting rhymes involving natural numbers						
a.	counts forward from a given number	→	★			
b.	counts forward or backward	→	★	→	★	→ ★
c.	skip counts (e.g. by twos)	→	★	→	★	→ ★
2. Counts collections (using objects or drawings)						
a.	matches the gesture to the corresponding number word; recognizes the cardinal aspect of a number and the conservation of number in various combinations	★				
b.	counts from a given number	→	★			
c.	counts a collection by grouping or regrouping	→	★	→	★	→ ★
d.	counts a pre-grouped collection			→	★	→ ★
3. Reads and writes any natural number						
		→	★	→	★	→ ★
4. Represents natural numbers in different ways or associates a number with a set of objects or drawings						
a.	emphasis on apparent, accessible groupings using objects, drawings or unstructured materials (e.g. tokens, nesting cubes, groups of ten objects placed inside a bag and ten of these bags placed inside another container)	→	★			

b. emphasis on exchanging apparent, non-accessible groupings, using structured materials (e.g. base ten blocks, number tables)	→	→	★		
c. emphasis on place value in non-apparent, non-accessible groupings, using materials for which groupings are symbolic (e.g. abacus, money)		→	→	→	★
5. Composes and decomposes a natural number in a variety of ways (e.g. $123 = 100 + 23$ $123 = 100 + 20 + 3$ $123 = 50 + 50 + 20 + 3$ $123 = 2 \times 50 + 30 - 7$ $123 = 2 \times 60 + 3$ )	→	★	→	★	→ ★
6. Identifies equivalent expressions (e.g. $52 = 40 + 12$ , $25 + 27 = 40 + 12$ , $52 = 104 \div 2$ )	→	★	→	★	→ ★
7. Compares natural numbers	→	★	→	★	→ ★
8. Arranges natural numbers in increasing or decreasing order	→	★	→	★	→ ★
9. Describes number patterns, using his/her own words and appropriate mathematical vocabulary (e.g. even numbers, odd numbers, square numbers, triangular numbers, prime numbers, composite numbers)	→	★	→	★	→ ★
10. Locates natural numbers using different visual aids (e.g. hundreds chart, number strip, number line)	→	★	→	★	→ ★
11. Identifies properties of natural numbers					
a. odd or even numbers	→	★			
b. square, prime or composite numbers			→	★	
12. Classifies natural numbers in various ways, based on their properties (e.g. even numbers, composite numbers)	→	★	→	★	→ ★
13. Approximates a collection, using objects or drawings (e.g. estimate, round up/down to a given value)	→	★	→	★	→ ★
14. Represents the power of a natural number					→ ★
<b>Vocabulary</b> Grouping, digit, number, unit, tens place, hundreds place Natural number, even number, odd number <i>Is equal to, is bigger than (is greater than); is smaller than (is less than)</i> Increasing order, decreasing order Number line <b>Symbols</b> 0 to 9, <, >, =, numbers written using digits	→	★			
<b>Vocabulary</b> Base ten, position, place value, thousand, thousands place, ten thousands <i>Is not equal to; is greater than; is less than</i> Square number, composite number, prime number <b>Symbols</b> ≠, numbers written using digits			→	★	
<b>Vocabulary</b> Hundred thousands, million Exponent, power, squared, cubed Parenthesis <b>Symbols</b> ( ), numbers written using digits, exponential notation					→ ★
<b>B. Fractions (using objects or drawings)</b>	1	2	3	4	5 6
1. Identifies fractions related to everyday items (using objects or drawings)	→	★			
2. Represents a fraction in a variety of ways, based on a whole or a collection of objects	→	→	→	→	→ ★

3. Matches a fraction to part of a whole (congruent or equivalent parts) or part of a group of objects, and vice versa			→	★		
4. Identifies the different meanings of fractions (sharing, division, ratio)			→	→	→	→
5. Distinguishes a numerator from a denominator			→	★		
6. Reads and writes a fraction			→	★		
7. Compares a fraction to 0, $\frac{1}{2}$ or 1			→	★		
8. Verifies whether two fractions are equivalent			→	→	→	★
9. Matches a decimal or percentage to a fraction				→	→	★
10. Orders fractions with the same denominator				→	★	
11. Orders fractions where one denominator is a multiple of the other(s)					→	★
12. Orders fractions with the same numerator					→	★
13. Locates fractions on a number line					→	★
<b>Vocabulary</b> Fraction, half, one third, one quarter		→	★			
<b>Vocabulary</b> Numerator, denominator Whole, equivalent part, equivalent fraction <b>Symbol</b> Fractional notation				→	★	
<b>C. Decimals up to . . .</b>	1	2	3	4	5	6
					hundredths	thousandths
1. Represents decimals in a variety of ways (using objects or drawings)			→	★	→	★
2. Identifies equivalent representations (using objects or drawings)			→	★	→	★
3. Reads and writes numbers written in decimal notation			→	★	→	★
4. Understands the role of the decimal point			→	★		
5. Composes and decomposes a decimal written in decimal notation			→	★	→	★
6. Recognizes equivalent expressions (e.g. 12 tenths is equivalent to 1 unit and 2 tenths; 0.5 is equivalent to 0.50)			→	★	→	★
7. Locates decimals on a number line						
a. between two consecutive natural numbers			→	★	→	★
b. between two decimals				→	→	★
8. Compares two decimals			→	★	→	★
9. Approximates (e.g. estimates, rounds to a given value, truncates decimal places)			→	★	→	★
10. Arranges decimals in increasing or decreasing order			→	★	→	★
11. Matches						
a. a fraction to its decimal			→	★		
b. a fraction or percentage to its decimal					→	★

<b>Vocabulary</b> Decimal, tenth, hundredth <b>Symbol</b> Decimal notation				→	★		
<b>Vocabulary</b> Thousandth <b>Symbol</b> Decimal notation						→	★
<b>D. Integers</b>	1	2	3	4	5	6	
1. Represents integers in a variety of ways (using objects or drawings) (e.g. tokens in two different colours, number line, thermometer, football field, elevator, hot air balloon)				→	→	★	
2. Reads and writes integers					→	★	
3. Locates integers on a number line or Cartesian plane					→	★	
4. Compares integers					→	★	
5. Arranges integers in increasing or decreasing order					→	★	
<b>Vocabulary</b> Integer Negative number, positive number <b>Symbols</b> Integer notation, +/- calculator key					→	★	

- 
1. The set of rational numbers includes the set of integers, which contains the set of natural numbers.

# Mathematics

## Arithmetic

The concepts and processes to be acquired and mastered in arithmetic constitute the building blocks of mathematics, since they are applied in all other branches of this subject.

### Meaning of operations involving numbers

In order to fully understand operations and their different meanings in various contexts, students must understand the relationships among data and among operations, and choose and perform the correct operations, taking into account the properties and order of operations. Students must also have a general idea of the result expected.

Students will thus be encouraged to use concrete, semi-concrete or symbolic means to mathematize a variety of situations illustrating different meanings. In these situations, students will learn to break problems down into simpler ones and identify the relationships among data that will help them to arrive at a solution. Since operation sense is developed at the same time as number sense, the two should be taught concurrently.

The table below presents the learning content associated with the meaning of operations involving numbers. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

Meaning of operations involving numbers						
→	Elementary					
	Cycle One		Cycle Two		Cycle Three	
★	1	2	3	4	5	6
Student constructs knowledge with teacher guidance.						
Student applies knowledge by the end of the school year.						
Student reinvests knowledge.						
<b>A. Natural numbers less than . . .</b>	1000		100 000		1 000 000	
1. Determines the operation(s) to perform in a given situation	→	★	→	★	→	★
2. Uses objects, diagrams or equations to represent a situation and conversely, describes a situation represented by objects, diagrams or equations (use of different meanings of addition and subtraction)						
a. transformation (adding, taking away), uniting, comparing	→	★	→	★	→	★
b. composition of transformations: positive, negative			→	★	→	★
c. composition of mixed transformations					→	★
3. Uses objects, diagrams or equations to represent a situation and conversely, describes a situation represented by objects, diagrams or equations (use of different meanings of multiplication and division)						
a. rectangular arrays, repeated addition, Cartesian product, sharing, and number of times $x$ goes into $y$ (using objects and diagrams)	→	★				
b. rectangular arrays, repeated addition, Cartesian product, area, volume, repeated subtraction, sharing, number of times $x$ goes into $y$ , and comparisons (using objects, diagrams or equations)			→	★	→	★
4. Establishes equality relations between numerical expressions (e.g. $3 + 2 = 6 - 1$ )	→	★	→	★	→	★
5. Determines numerical equivalencies using relationships between						
a. operations (addition and subtraction) and the commutative property of addition	→	★				
b. operations (the four operations), the commutative property of addition and multiplication and the associative property			→	★		
c. operations (the four operations), the commutative property of addition and multiplication, the associative property and the distributive property of multiplication over addition or subtraction					→	★
6. Translates a situation using a series of operations in accordance with the order of operations					→	★
<b>Vocabulary</b> Plus, minus, less, more Addition, subtraction, sum, difference	→	★				

<b>Symbols</b> +, −												
<b>Vocabulary</b> At least, at most, term, missing term Multiplication, factor, product Division, divisor, dividend, quotient, remainder, sharing Equality, inequality, equation, inverse operation, multiple

# Mathematics

## Arithmetic

The concepts and processes to be acquired and mastered in arithmetic constitute the building blocks of mathematics, since they are applied in all other branches of this subject.

### Operations involving numbers

As students gradually develop their number and operation sense, they will be called upon to develop their own processes and adopt conventional ones in order to perform various operations. They will learn to recognize equivalencies between these different processes and to develop certain automatic responses. Using these processes and the properties of operations, they will also learn to estimate results and obtain accurate results using mental and written computation.

The situations presented should involve numerical and non-numerical patterns (e.g. colours, shapes, sounds) to allow students to observe and describe various patterns and series of numbers and operations, such as a sequences of even numbers, multiples of 5 and triangular numbers. These situations will also require students to add terms to a series, state general rules or build models. Thus, students will learn to formulate or deduce definitions, properties and rules.

In all cycles, calculators may be used to good advantage as a calculation, verification and learning tool (e.g. in situations involving patterns, number decomposition, or the order of operations).

The table below presents the learning content associated with operations involving numbers. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

Operations involving numbers							
→	Student constructs knowledge with teacher guidance.	Elementary					
		Cycle One		Cycle Two		Cycle Three	
★	Student applies knowledge by the end of the school year.	1	2	3	4	5	6
	Student reinvests knowledge.						
<b>A. Natural numbers</b> (based on the benchmarks for each cycle)		1	2	3	4	5	6
1. Approximates the result of							
	a. an addition or subtraction involving natural numbers	→	★				
	b. any of the four operations involving natural numbers			→	→	→	★
2. Builds a repertoire of memorized addition and subtraction facts <sup>1</sup>							
	a. Builds a memory of addition facts <sup>2</sup> (0 + 0 to 10 + 10) and the corresponding subtraction facts, using objects, drawings, charts or tables	→	★				
	b. Develops various strategies that promote mastery of number facts and relates them to the properties of addition	→	→	★			
	c. Masters all addition facts (0 + 0 to 10 + 10) and the corresponding subtraction facts	→	→	★			
3. Develops processes for mental computation							
	a. Uses his/her own processes to determine the sum or difference of two natural numbers	→	★				
	b. Uses his/her own processes to determine the product or quotient of two natural numbers			→	→	→	★
4. Develops processes for written computation (addition and subtraction)							
	a. Uses his/her own processes as well as objects and drawings to determine the sum or difference of two natural numbers less than 1000	→	★				
	b. Uses conventional processes to determine the sum of two natural numbers of up to four digits			→	★		
	c. Uses conventional processes to determine the difference between two natural numbers of up to four digits whose result is greater than 0			→	★		

5. Determines the missing term in an equation (relationships between operations): $a + b = \square$ , $a + \square = c$ , $\square + b = c$ , $a - b = \square$ , $a - \square = c$ , $\square - b = c$	→	★				
<b>6. Builds a repertoire of memorized multiplication and division facts</b>						
a. Builds a memory of multiplication facts ( $0 \times 0$ to $10 \times 10$ ) and the corresponding division facts, using objects, drawings, charts or tables		→	★			
b. Develops various strategies that promote mastery of number facts and relate them to the properties of multiplication		→	→	★		
c. Masters all multiplication facts ( $0 \times 0$ to $10 \times 10$ ) and the corresponding division facts		→	→	★		
<b>7. Develops processes for written computation (multiplication and division)</b>						
a. Uses his/her own processes as well as materials and drawings to determine the product or quotient of a three-digit natural number and a one-digit natural number, expresses the remainder of a division as a fraction, depending on the context		→	★			
b. Uses conventional processes to determine the product of a three-digit natural number and a two-digit natural number				→	★	
c. Uses conventional processes to determine the quotient of a four-digit natural number and a two-digit natural number, expresses the remainder of a division as a decimal that does not go beyond the second decimal place				→	★	
8. Determines the missing term in an equation (relationships between operations): $a \times b = \square$ , $a \times \square = c$ , $\square \times b = c$ , $a \div b = \square$ , $a \div \square = c$ , $\square \div b = c$		→	→	→	★	
9. Decomposes a number into prime factors			→	→	★	
10. Calculates the power of a number				→	★	
11. Determines the divisibility of a number by 2, 3, 4, 5, 6, 8, 9, 10				→	★	
12. Performs a series of operations in accordance with the order of operations				→	★	
<b>13. Using his/her own words and mathematical language that is at an appropriate level for the cycle, describes</b>						
a. non-numerical patterns (e.g. series of colours, shapes, sounds, gestures)	→	★				
b. numerical patterns (e.g. number rhymes, tables and charts)	→	★				
c. series of numbers and family of operations	→	→	→	→	→	★
14. Adds new terms to a series when the first three terms or more are given	→	→	→	→	→	★
<b>15. Uses a calculator and</b>						
a. becomes familiar with its basic functions (+, −, =, 0 to 9 number keys, all clear, clear)	→	★				
b. becomes familiar with its × and ÷ functions			→	★		
c. becomes familiar with memory keys and change of sign keys (+/−)					→	★
<b>Vocabulary</b> Pattern, series <b>Symbols</b> Calculator keys		→	★			
<b>B. Fractions (using objects or diagrams)</b>						
1. Generates a set of equivalent fractions			→	→	→	★
2. Reduces a fraction to its simplest form (lowest terms)					→	★
3. Adds and subtracts fractions when the denominator of one fraction is a multiple of the other fraction(s)					→	★
4. Multiplies a natural number by a fraction					→	★
<b>Vocabulary</b> Irreducible fraction					→	★

C. Decimals	1	2	3	4	5	6
1. Approximates the result of						
a. an addition or a subtraction				→	→	→ ★
b. a multiplication or division					→	★
2. Develops processes for mental computation						
a. adds and subtracts decimals				→	→	→ ★
b. performs operations involving decimals (multiplication, division by a natural number)					→	★
c. multiplies and divides by 10, 100, 1000					→	★
3. Develops processes for written computation						
a. adds and subtracts decimals whose result does not go beyond the second decimal place				→	★	
b. multiplies decimals whose product does not go beyond the second decimal place					→	★
b. divides a decimal by a natural number less than 11					→	★
<b>Symbols</b> \$, ¢				→	★	
D. Using Numbers	1	2	3	4	5	6
1. Expresses a decimal as a fraction, and vice versa					→	★
2. Expresses a decimal as a percentage, and vice versa					→	★
3. Expresses a fraction as a percentage, and vice versa					→	★
4. Chooses an appropriate number form for a given context					→	★
<b>Vocabulary</b> Percentage <b>Symbol</b> %					→	★

1. The development of a repertoire of number facts requires more than mere memorization of tables.
2. The basic additions (and the corresponding subtractions) and multiplications (and the corresponding divisions) include operations whose terms and factors are less than 11.

# Mathematics

## Geometry

Before they enter preschool, children explore the shapes of objects in their surroundings and begin to understand basic topological concepts such as inside-outside, above-below; they also acquire the rudiments of spatial sense. In preschool, they begin to organize space and establish relationships between objects by comparing, classifying and grouping them.

Throughout elementary school, by participating in activities and manipulating objects, students acquire the vocabulary of geometry and learn to get their bearings in space, identify plane figures and solids, describe categories of figures and observe their properties. Geometry in elementary school focuses on two-dimensional (plane) and three-dimensional figures and on key concepts, such as the ability to locate objects in space and observe their geometric and topological properties. Knowledge of vocabulary is not enough; the words must be closely tied to precise concepts such as shape, similarity, dissimilarity, congruency and symmetry. Thus, the use of varied activities and a wide range of objects is essential for students to develop spatial sense and geometric thought. This will allow students to progress from the concrete to the abstract, first by manipulating and observing objects, then by making various representations, and finally by creating mental images of figures and their properties.

The ability to discern and recognize the properties of a geometric object or a category of objects must be developed before students can learn about the relationships among elements in a figure or among distinct figures. It is also required in order to develop the ability to identify new properties and use known or new properties in problem solving.

The table below presents the learning content associated with geometry. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

 Student constructs knowledge with teacher guidance.  Student applies knowledge by the end of the school year.  Student reinvests knowledge.	Elementary					
	Cycle One		Cycle Two		Cycle Three	
A. Space	1	2	3	4	5	6
1. Gets his/her bearings and locates objects in space (spatial relationships)	→	★				
2. Locates objects in a plane	→	→	→	★		
3. Locates objects on an axis (based on the types of numbers studied)	→	★	→	★	→	★
4. Locates points in a Cartesian plane						
a. in the first quadrant	→	→	→	★		
b. in all four quadrants					→	★
<b>Vocabulary</b> Reference system, plane, Cartesian plane, ordered pair	→	→	→	★		
<b>Symbols</b> Writing ordered pairs $(a, b)$	→	→	→	→	→	★
B. Solids	1	2	3	4	5	6
1. Compares objects or parts of objects in the environment with solids (e.g. spheres, cones, cubes, cylinders, prisms, pyramids)	→	★				
2. Compares and constructs solids (e.g. spheres, cones, cubes, cylinders, prisms, pyramids)	→	★				
3. Identifies the main solids (e.g. spheres, cones, cubes, cylinders, prisms, pyramids)	→	★				
<b>Vocabulary</b> Solid, base of a solid, face, flat surface, curved surface Sphere, cone, cube, cylinder, prism, pyramid	→	★				
4. Identifies and represents the different faces of a prism or pyramid	→	★				

5. Describes prisms and pyramids in terms of faces, vertices and edges			→	★		
6. Classifies prisms and pyramids			→	★		
7. Constructs a net of a prism or pyramid			→	★		
8. Matches the net of						
a. a prism to the corresponding prism and vice versa			→	→	★	
b. a pyramid to the corresponding pyramid and vice versa			→	→	★	
c. a convex polyhedron to the corresponding convex polyhedron					→	★
<b>Vocabulary</b> Vertex, edge, net of a solid			→	★		
9. Tests Euler's theorem on convex polyhedrons					→	★
<b>Vocabulary</b> Polyhedron, convex polyhedron					→	★
<b>C. Plane figures</b>	1	2	3	4	5	6
1. Compares and constructs figures made with closed curved lines or closed straight lines	→	★				
2. Identifies plane figures (square, rectangle, triangle, rhombus and circle)	→	★				
3. Describes plane figures (square, rectangle, triangle and rhombus)	→	★				
<b>Vocabulary</b> Straight line, closed straight line, curved line Plane figure, side Square, circle, rectangle, triangle, rhombus	→	★				
4. Describes convex and nonconvex polygons			→	★		
5. Identifies and constructs parallel lines and perpendicular lines			→	★		
6. Describes quadrilaterals (e.g. parallel segments, perpendicular segments, right angles, acute angles, obtuse angles)			→	★		
7. Classifies quadrilaterals			→	★		
<b>Vocabulary</b> Quadrilateral, parallelogram, trapezoid, polygon Convex polygon, nonconvex polygon, segment <i>Is parallel to . . . ; is perpendicular to . . .</i> <b>Symbols</b> $//$ , $\perp$			→	★		
8. Describes triangles: scalene triangles, right triangles, isosceles triangles, equilateral triangles					→	★
9. Classifies triangles					→	★
10. Describes circles					→	★
<b>Vocabulary</b> Equilateral triangles, isosceles triangle, right triangle, scalene triangle Circle, central angle, diameter, radius, circumference					→	★
<b>D. Frieze patterns and tessellations</b>	1	2	3	4	5	6
1. Identifies congruent figures	→	★				

2. Observes and produces patterns using geometric figures	→	→	→	★		
3. Observes and produces frieze patterns and tessellations						
a. using reflections			→	★		
b. using translations					→	★
<b>Vocabulary</b> Frieze pattern, tessellation Reflection, line of reflection, symmetric figure			→	★		
<b>Vocabulary</b> Translation, translation arrow					→	★

# Mathematics

## Measurement

Before they enter preschool, children have acquired the rudiments of measurement in that they have begun to evaluate and compare size. In preschool, they begin to measure things using instruments such as a rope or growth chart.

Establishing a relationship between two geometric figures means recognizing similar shapes or identical measurements (congruence) but also realizing that a figure can fit inside another repeatedly to completely cover it (tessellation, measurement). Measuring therefore involves much more than merely taking a reading on an instrument. Measurement sense is developed by making comparisons and estimates, using a variety of conventional and unconventional units of measure. To develop their sense of measuring (of time, mass, capacity, temperature, angles, length, area and volume), students must participate in activities that allow them to design and build instruments, to use invented and conventional measuring instruments and to manipulate conventional units of measure. They must learn to calculate direct measurements (e.g. calculate a perimeter or area, graduate a ruler) and indirect measurements (e.g. read a scale drawing, make a scale drawing, measure the area of a figure by decomposing it, calculate the thickness of a sheet of paper when the thickness of several sheets is known).

The table below presents the learning content associated with measurement. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

 Student constructs knowledge with teacher guidance.  Student applies knowledge by the end of the school year.  Student reinvests knowledge.	Elementary

2. Establishes relationships between units of measure	→	→	→	→	→	★
<b>Vocabulary</b> Day, hour, minute, second <b>Symbols</b> h, min, s, representation of time: 3 h, 3 h 25 min, 03:25, 3:25 a.m.	→	★				
<b>Vocabulary</b> Daily cycle, weekly cycle, yearly cycle	→	→	→	★		
<b>H. Temperatures</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>
1. Estimates and measures temperature using conventional units	→	→	→	→	→	★
<b>Vocabulary</b> Degree Celsius <b>Symbol</b> °C	→	★				

# Mathematics

## Statistics

Throughout elementary school, students participate in conducting surveys to answer questions and draw conclusions. They learn to formulate different types of questions, determine categories or answer choices, plan and carry out data collection and organize data in tables. To develop statistical thinking, students are thus introduced to descriptive statistics, which allow them to summarize raw data in a clear and reliable (rigorous) way.

By participating in the activities suggested, students will learn to display data using tables, horizontal and vertical bar graphs, pictographs or broken-line graphs, depending on the type of data used. They will also learn to interpret data by observing its distribution (e.g. range, centre, groupings) or by comparing data in a given table or graph. They will ask themselves questions as they compare different questions, samples chosen, the data obtained and their different representations. They will also have the opportunity to interpret circle graphs<sup>1</sup> and develop an understanding of the arithmetic mean in order to be able to calculate it.

The table below presents the learning content associated with statistics. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

	→ Student constructs knowledge with teacher guidance.	Elementary					
		Cycle One		Cycle Two		Cycle Three	
		1	2	3	4	5	6
	★ Student applies knowledge by the end of the school year.						
	Student reinvests knowledge.						
1.	Formulates questions for a survey (based on age-appropriate topics, students' language level, etc.)	→	→	→	→	→	★
2.	Collects, describes and organizes data (classifies or categorizes) using tables	→	→	→	→	→	★
3.	<b>Interprets data using</b>						
a.	a table, a bar graph and a pictograph	→	★				
b.	a table, a bar graph, a pictograph and a broken-line graph			→	★		
c.	<b>a table, a bar graph, a pictograph, a broken-line graph and a circle graph</b>					→	★
4.	Displays data using						
a.	a table, a bar graph and a pictograph	→	★				
b.	a table, a bar graph, a pictograph and a broken-line graph			→	★		
5.	Understands and calculates the arithmetic mean					→	★
<b>Vocabulaire</b>	Survey, table Bar graph, pictograph	★					
<b>Vocabulaire</b>	Broken-line graph			→	★		
<b>Vocabulaire</b>	<b>Circle graph</b> , arithmetic mean					→	★

1. Students are not expected to construct circle graphs, but rather to interpret them using the concepts of fraction and percentage.

# Mathematics

## Probability

When attempting to determine the probability of an event, students in elementary school spontaneously rely on intuitive, yet often arbitrary, reasoning. Their predictions may be based on emotions, which may cause them to wish for a predicted outcome or to refute actual results. The classroom activities suggested should help foster probabilistic reasoning. This implies taking into account the uncertainty of outcomes, which may represent a challenge of sorts, since students will tend to determine outcomes by looking for patterns or expecting outcomes to balance out.<sup>1</sup>

In elementary school, students observe and conduct experiments involving chance. They use qualitative reasoning to practise predicting outcomes by becoming familiar with concepts of certainty, possibility and impossibility. They also practise comparing experiments to determine events that are more likely, just as likely and less likely to occur. They list the outcomes of a random experiment using tables or tree diagrams and use quantitative reasoning to compare the actual frequency of outcomes with known theoretical probabilities.

The table below presents the learning content associated with probability. The concepts and processes targeted will provide students with increasingly complex tools that will help them develop and use all three mathematics competencies.

	→	Elementary					
		Cycle One		Cycle Two		Cycle Three	
	★	1	2	3	4	5	6
Student constructs knowledge with teacher guidance.							
Student applies knowledge by the end of the school year.							
Student reinvests knowledge.							
1. When applicable, recognizes variability in possible outcomes (uncertainty)	→	→	→	→	→	→	★
2. When applicable, recognizes equiprobability (e.g. quantity, symmetry of an object [cube])	→	→	→	→	→	→	★
3. When applicable, becomes aware of the independence of events in an experiment	→	→	→	→	→	→	★
4. Experiments with activities involving chance, using various objects (e.g. spinners, rectangular prisms, glasses, marbles, thumb tacks, 6-, 8- or 12-sided dice)	→	→	→	→	→	→	★
5. Predicts qualitatively an outcome or several events using a probability line, among other things							
a. certain, possible or impossible outcome	→	→	→	→	→	→	★
b. more likely, just as likely, less likely event			→	→	→	→	★
6. Distinguishes between prediction and outcome	→	→	→	→	→	→	★
7. Uses tables or diagrams to collect and display the outcomes of an experiment	→	→	→	→	→	→	★
8. Enumerates possible outcomes of							
a. a simple random experiment	→	★					
b. a random experiment, using a table, a tree diagram			→	→	→	→	★
9. Compares qualitatively the theoretical or experimental probability of events			→	→	→	→	★
10. Recognizes that a probability is always between 0 and 1					→	→	★
11. Uses fractions, decimals or percentages to quantify a probability					→	→	★
12. Compares the outcomes of a random experiment with known theoretical probabilities					→	→	★
13. Simulates random experiments with or without the use of technology			→	→	→	→	★
<b>Vocabulary</b> Chance, random experiment, enumeration, tree diagram Certain outcome, possible outcome, impossible outcome Event, likely, just as likely, more likely, less likely, event probability	→	→	→	→	→	→	★

- 
1. For example, if the pointer on a two-coloured spinner (red and yellow) stops on yellow three times, students will expect it to stop on red when it's their turn.

## Examples of Strategies

The strategies that are helpful for the development and use of the three mathematics competencies are integrated into the learning process. It is possible to emphasize some of these strategies, depending on the situation and educational intent. Since students must build their own personal repertoire of strategies, it is important to encourage them to become independent in this regard and help them learn how to use these strategies in different contexts.

Cognitive and metacognitive strategies	
Strategies	Reflection
Planning	<ul style="list-style-type: none"> <li>■ What is the task that I am being asked to do?</li> <li>■ What prior learning do I need to use?</li> <li>■ What information is relevant?</li> <li>■ Do I need to break the problem down?</li> <li>■ How much time will I need to do this task?</li> <li>■ What resources will I need?</li> </ul>
Comprehension	<ul style="list-style-type: none"> <li>■ Which terms seem to have a mathematical meaning different from their meaning in everyday language?</li> <li>■ What is the purpose of the question? Am I able to explain it in my own words?</li> <li>■ Do I need to find a counter-example to prove that what I am stating is false?</li> <li>■ Is all the information in the situation relevant? Is some information missing?</li> <li>■ What kind of diagram could demonstrate the steps involved in the task?</li> </ul>
Organization	<ul style="list-style-type: none"> <li>■ Should I group, list, classify, reorganize or compare the data, or use diagrams (representations that show the relationships between objects or data)?</li> <li>■ Can I use concrete objects or simulate or mime the situation?</li> <li>■ Can I use a table or chart? Should I draw up a list?</li> <li>■ Are the main ideas in my approach well represented?</li> <li>■ What concepts and mathematical processes should I use?</li> <li>■ What type of representation (words, symbols, figures, diagrams, tables, etc.) could I use to translate this situation?</li> </ul>
Development	<ul style="list-style-type: none"> <li>■ Can I represent the situation mentally or in written form?</li> <li>■ Have I solved a similar problem before?</li> <li>■ What additional information could I find using the information I already have?</li> <li>■ Have I used the information that is relevant to the task? Have I considered the unit of measure, if applicable?</li> <li>■ What mathematical expression translates the situation?</li> <li>■ Can I see a pattern?</li> <li>■ Which of the following strategies could I adopt?               <ul style="list-style-type: none"> <li>■ Make systematic trials</li> <li>■ Work backwards</li> <li>■ Give examples</li> <li>■ Break the problem down</li> <li>■ Change my point of view</li> <li>■ Eliminate possibilities</li> <li>■ Simplify the problem (e.g. reduce the number of data values, replace values by values that can be manipulated more easily, rethink the situation with regard to a particular element)</li> </ul> </li> </ul>
Regulation	<ul style="list-style-type: none"> <li>■ Is my approach effective and can I explain it?</li> <li>■ Can I check my solution using reasoning based on an example or a counter-example?</li> <li>■ What I have I learned? How did I learn it?</li> <li>■ Did I choose an effective strategy and take the time I needed to fully understand the problem?</li> <li>■ What are my strengths and weaknesses?</li> <li>■ Did I adapt my approach to the task?</li> <li>■ What was the result expected?</li> <li>■ How can I explain the difference between the expected result and the actual result?</li> <li>■ What strategies used by my classmates or suggested by the teacher can I add to my repertoire of strategies?</li> </ul>

	<ul style="list-style-type: none"> <li>■ Can I use this approach in other situations?</li> </ul>
Generalization	<ul style="list-style-type: none"> <li>■ In what ways are the examples similar or different?</li> <li>■ Which models can I use again?</li> <li>■ Can the observations made in a particular case be applied to other situations?</li> <li>■ Are the assertions I made or conclusions I drew always true?</li> <li>■ Did I identify examples or counterexamples?</li> <li>■ Did I see a pattern?</li> <li>■ Am I able to formulate a rule?</li> </ul>
Retention	<ul style="list-style-type: none"> <li>■ What methods did I use (e.g. repeated something several times to myself or out loud; highlighted, underlined, circled, recopied important concepts; made a list of terms or symbols)?</li> <li>■ Would I be able to solve the problem again on my own?</li> <li>■ What characteristics would a situation need in order for me to reuse the same strategy?</li> <li>■ Is what I learned connected in any way to what I already knew?</li> </ul>
Development of automatic processes	<ul style="list-style-type: none"> <li>■ Did I find a solution model and list the steps involved?</li> <li>■ Did I practise enough in order to be able to repeat the process automatically?</li> <li>■ Am I able to effectively use the concepts learned?</li> <li>■ Did I compare my approach to that of others?</li> </ul>
Communication	<ul style="list-style-type: none"> <li>■ Did I show enough work so that my approach was understandable?</li> <li>■ What forms of representation (words, symbols, figures, diagrams, tables, etc.) did I use to interpret a message or convey my message?</li> <li>■ Did I experiment with different ways of conveying my mathematical message?</li> <li>■ Did I use an effective method to convey my message?</li> <li>■ What methods would have been as effective, more effective or less effective?</li> </ul>
<b>Other strategies</b>	
<b>Reflection</b>	
Affective strategies	<ul style="list-style-type: none"> <li>■ How do I feel?</li> <li>■ What do I like about this situation?</li> <li>■ Am I satisfied with what I am doing?</li> <li>■ What did I do particularly well in this situation?</li> <li>■ What methods did I use to overcome difficulties and which ones helped me the most to: <ul style="list-style-type: none"> <li>■ reduce my anxiety?</li> <li>■ stay on task?</li> <li>■ control my emotions?</li> <li>■ stay motivated?</li> </ul> </li> <li>■ Am I willing to take risks?</li> <li>■ What are my successes?</li> <li>■ Do I enjoy exploring mathematical situations?</li> </ul>
Resource management strategies	<ul style="list-style-type: none"> <li>■ Whom can I turn to for help and when should I do so?</li> <li>■ Did I accept the help offered?</li> <li>■ What documentation (e.g. glossary, ICT) did I use? Was it helpful?</li> <li>■ What manipulatives helped me in my task?</li> <li>■ Did I estimate the time needed for the activity correctly?</li> <li>■ Did I plan my work well (e.g. planned short, frequent work sessions; set goals to attain for each session)?</li> <li>■ What methods did I use to stay on task (appropriate environment, available materials)?</li> </ul>
